sequence search

Hi! I'd like a sequence search performed for case 09/762,594:

1. the nucleic acid sequence of SEQ ID NO: 2

Thanks!

Bridget Bunner

The invention provides isolated peripheral-type benzodiazepine receptor (PBR) associated proteins (PAPS) and nucleic acids encoding the PAP proteins. The PAP polynuclectides are a source of primers and probes for detection, isolation and amplification. PAP ligands or substrates or antibodies can be labeled and used to detect PAPS, in the diagnosis and prognosis of disease associated with increased cell proliferation, such as cancer, or reduced cell death. The diagnostic methods of the invention can be predictive of diseases involving PBR including allstones, atherosclerosis, Niemann-Pick C, Sitosterolemia, Distrophy, tumor proliferation, Schnyder's corneal crystalline dystrophy, brain disorders including Alzheimer's disease, cholesterol metabolism, cevelopmental abnormalities, demyelinization, Charcot-Marie tooth characteries and such and share and share the propriet of the propriet of the propriet disease, Multiple sclerosis, and share the content of the propriet of the prop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             methods may also be useful in prophylactic treatments, or in screening for compounds effective in prophylactic treatment. The PAPs may be used to identify inhibitors or activators which allows the identification of drugs or agents which modulate PBR activity. Inhibitors of PAP may be used in the treatment or amelioration of conditions such as stress and stroke, cancer, neurodegenerative disorders, developmental disorders, infertility and immune disorders. The present sequence represents a cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nseq

The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hammatopolesis requisiting activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequences AAZ87205-Z87210 represent cDNAs encoding six human
neurotransmission-associated proteins (NTAPS, AAY77121-Y77126). The
present sequence, clone 998868, encodes a benzodiazepine
receptor-associated from a human kidney tumour cDNA library. The NTAPS are
fragments isolated from a human kidney tumour cDNA library. The NTAPS are
used for treatment or prevention of neurological diseases (e.g.,
Alzheimer's, Parkinson's or Huntington's diseases, cerebral neoplasms, or
multiple sclerosis). They can also be used to raise specific antibodies
and to screen for specific binding agents (potential (agonists and
antosociates) NTAP-encoding nucleic acids are useful for recombinant
cantagonists). NTAP-encoding nucleic acids are useful for recombinant
cantagonists, and as a source of therapeutic antagonists
(antisense, triplex-forming or ribozyme molecules). The nucleic acids may
also be used as a source of probes and primers for diagnosis or
cantagoriated or NTAP expression in hybridisation/amplification tests, for
chromosome mapping and for identifying related sequences, and for gene
therapy. NTAP antagonists are used to treat and prevent a wide range of
cancers and immune disorders (e.g. AIDS, asthma, Crohn's disease,

```
The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80322) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                            (AAK52582) and 3666

The present sequence is the coding sequence for a human secreted protein. It was isolated from an adult pancreas cDNA library. The proteins and coding sequences of the invention can be used in the isolation of similar genes and proteins, in the elucidation of their function in vivo, and to treat a number of conditions. It is possible that they may have uses as nutritional supplements, as cytokine or cell proliferation factors, in immune modulation, where they may be used to treat immune and autoimmune diseases, as haematopoiesis regulators (treating myeloid or lymphoid cell deficiencies), in the promotion of tissue growth, they may have chemokine or chemotactic activity, haemostatic or thrombolytic activity, or anti-inflammatory activity.
                                                                                                                                                                                                                                                                                                                                                                                           New secreted proteins and polynucleotides encoding them, which are derived from Homo sapiens, useful for therapy, diagnosis, and research,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AGACCACAAATCAAAGACTTTAAAGAGAAGATTCGGCAGGATGCAGATTCTGTGATTACA 1000

antipsoriatic, antiparkinsonian, nootropic; neuroprotective; osteopathic; antiporulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coaquiant; vasotropic; antidiabetic; hypotensive; dermatchic; capulant; vasotropic; antidiabetic; antidiabetic; hypotensive; dermatchic; antidiamentory; antibacterial; antiviral; antifungal; antirheumatic; antidializand and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus capterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, concurred antidicipal antidificanaetory disease; to enhance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Murine transport and binding associated protein encoding cDNA SEQ ID 327.
                                                                                                                                                                                                                                                 which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ
                                                                                                                                                                                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                       This invention describes a novel gene library (A) comprises a gene sequence (or its part) encoding a protein involved in amino acid synthesis, cellular/energy metabolism, metabolism of fatty acids/phospholipids, synthesis or breakdown of purines/pyrimidines/nucleosides/nucleotides, DNA replication/transcription/translation, or is a transport/binding protein. (A) are produced that correspond to the 3'-end of mRNA but without the polyA tail. They can be prepared more efficiently and with less effort than conventional libraries. AAK53436-AAK54275 represent fragments of the gene library described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            vulnerary; antipsoriatic; antiparkinsonian; nootropic; neuroprotective; antisonidasnt; osteopathic; antiarthritic; immunosupressant; cardiant; immunostimulant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory;
                                                                                                                                                       Gene library containing sequences with specific 3'-ends and no polyA tail, encoding proteins involved in a wide range of cellular processes

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary: antipsoriatic; antiportiant; antiarthritic; immunosuppressant; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotrensive; dermatological; immunosuppressive; antidiabetic; hypotrensive; dermatological; antithungal; antirheumatic; antithroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating candidathological conditions associated with an ORFX associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, concurrant has emoglopinaria, antinflammatory disease; to enhance

                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel human lung cancer polynucleotide (I) and polypeptides (II). (I) and (II) are useful in pharmaceutical compositions, such as vaccines, for the diagnosis and treatment of lung cancer. The polynucleotides are also useful as probes or primers for nucleic acid hybridisation. ABK24314-ABK24397 represent human lung

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides are useful: to assess if a patient is afflicted with cervical cancer or has a pre-mailgnant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cervical cancer; cytostatic; pre-malignant condition; gene therapy; ss.

foetal liver; gene expression; single exon nucleic acid probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel human lung cancer polynucleotide (I) and polypeptides (II). (I) and (II) are useful in pharmaceutical compositions, such as vaccines, for the diagnosis and treatment of lung cancer. The polynucleotides are also useful as probes or primers for nucleic acid hybridisation. ABK24314-ABK24397 represent human lung cancer coding sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1305 ATCCAGGGAGGGGAGTCTATCTCCTCAAGTTTGATAATTCCTACTCTGTGGAGGTCCA 1364

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
control of diseases associated with inappropriate (I) expression of the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
considered may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
cancers and cancer metastases of haematopoietic-derived cells. AAK64703
connects and cancer metastases of haematopoietic-derived cells. AAK64703
connects and encer metastases of haematopoietic antigen genomic
sequences from the present invention. AAK54942 to AAK84950 and AAM82169
connects and cancer metastases.

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1081 CAGTTATGACATTGGGTTTGGGGTTTATTTGAATGGACAGACTCTCCAAATGCTGCTGT 1140

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1021 CACCGTCCGAGTCCCGACTCATGAGGATCATACCTATTTTGGGAATTTGCCACAGA 1080
